

Commercial Performance Dashboard | Power BI Project Overview

This project analyses **sales, customer and market performance** across a multi-country retail dataset. The dashboard was designed as an executive commercial reporting tool, bringing together revenue performance, customer activity, product performance, cancellations and geographic market analysis within a single interactive view.

Users can dynamically analyse performance by **year, country and product type**, allowing the dashboard to move from an overall commercial overview to more focused market and product-level analysis.

Tools & Skills:

Power BI · Power Query · DAX · Data Modelling · Data Transformation · Interactive Filtering · KPI Development · Commercial Analytics · Data Visualisation

The Commercial Performance Dashboard provides a consolidated view of the organisation's **sales performance, customer base, product portfolio and international presence**. It is designed to help identify both the major drivers of revenue and areas of potential commercial concern.

Key Features

- **Executive KPIs** track revenue, orders, customers, average order value, cancellation rate and the total value of cancelled transactions.
- **Monthly Revenue Trend** highlights changes in sales performance over time and makes seasonal peaks and declines immediately visible.
- **Top 10 Products by Revenue** identifies the products contributing most strongly to overall commercial performance.
- **Cancellation Value & Rate Over Time** combines the financial value of cancellations with the proportion of invoices cancelled, allowing both the scale and frequency of cancellations to be monitored.

- **Global Revenue by Market** provides a geographic view of the organisation's international customer base.
- **UK vs International Revenue Mix** shows the relative contribution of domestic and overseas sales.
- **Top International Markets** ranks overseas markets by revenue to identify the organisation's strongest international territories.
- Dynamic **Year, Country and Product Type filters** allow the entire dashboard to respond to the user's selected commercial segment.

Technical Implementation

Multiple retail data sources were cleaned and transformed using **Power Query** before being integrated into a structured Power BI data model. **DAX measures** were developed to calculate dynamic commercial KPIs including total revenue, order volume, customer counts, average order value, cancellation value and cancellation rate.

The dashboard combines **time-series analysis, product ranking, geographic analysis, market segmentation and cancellation monitoring** within a single interactive reporting environment. Cross-filtering and slicers allow users to investigate how performance changes across different countries, periods and product categories.

The report enables users to quickly assess **when revenue is strongest, which products generate the most value, where international revenue originates and how cancellations affect commercial performance**. Bringing these measures together provides a broader view of business performance than revenue alone and helps identify opportunities for growth alongside potential areas of revenue leakage.

Data - <https://archive.ics.uci.edu/dataset/502/online+retail+ii>

Commercial retail transaction dataset covering **2010–2011**, including transactions, customers, products, cancellations and geographic markets.
